

Data Assimilation Survey:

BACY = Basic Cycling

A Data Assimilation Testbed for Research and Development

University of Reading

Nov 12, 2014

Roland Potthast

Full NWP System – Integrates **Cycled** Model and Data Assimilation

Precipitation 01.01.2013 06 UTC + 24h (DE)

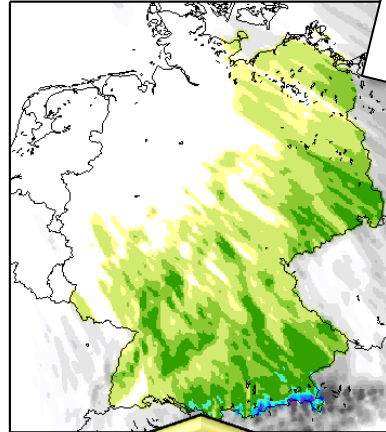

Mean: 3.5964 Min: 0.0000 Max: 10.0000 Var: 7.0555

Precipitation 02.01.2013 06 UTC + 24h (DE)

Mean: 1.3271 Min: 0.0000 Max: 5.0000 Var: 3.0810

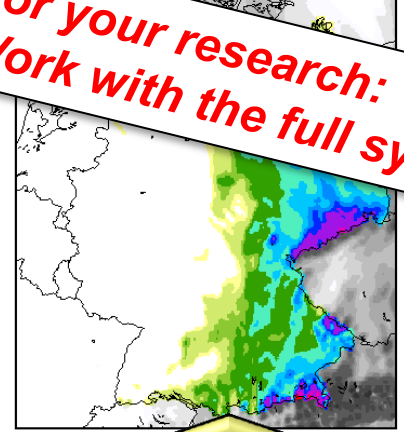

Precipitation 03.01.2013 06 UTC + 24h (DE)

Mean: 2.1553 Min: 0.0000 Max: 7.0000 Var: 7.8932

**For your research:
Work with the full system!**

Precipitation 04.01.2013 06 UTC + 24h (DE)

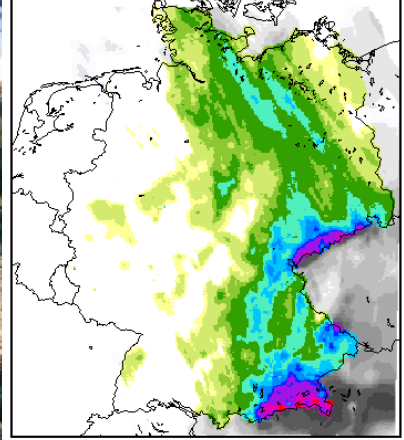

Mean: 5.9361 Min: 0.0000 Max: 15.0000 Var: 65.027

Example: Radar Data 3d Volume Scan

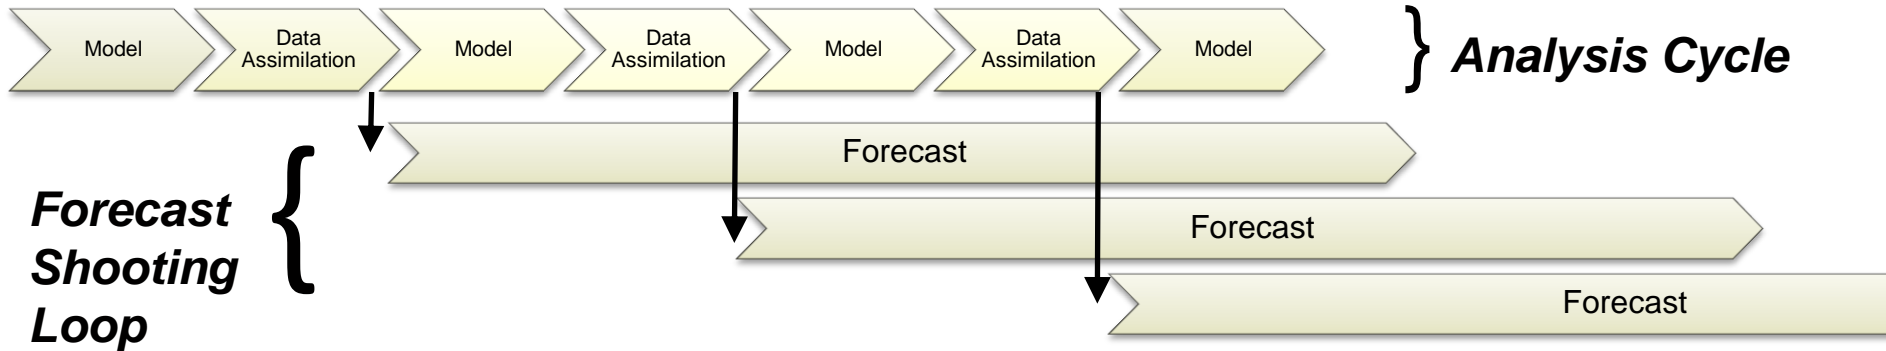

Precipitation 04.01.2013 06 UTC + 24h (RU)

Mean: 5.3058 Min: 0.0000 Max: 115.43 Var: 72.542

Full NWP System – Integrates Cycled Model and Data Assimilation

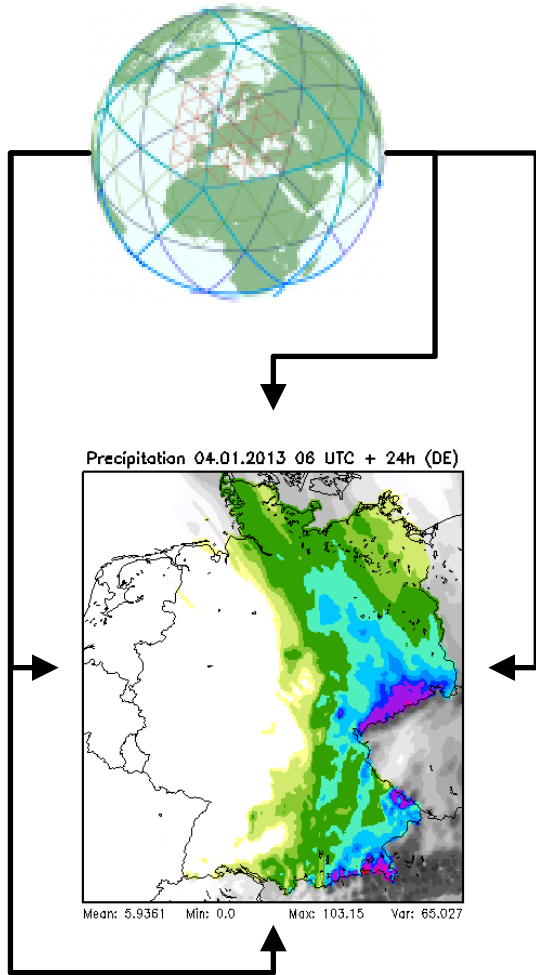

Some Arguments:

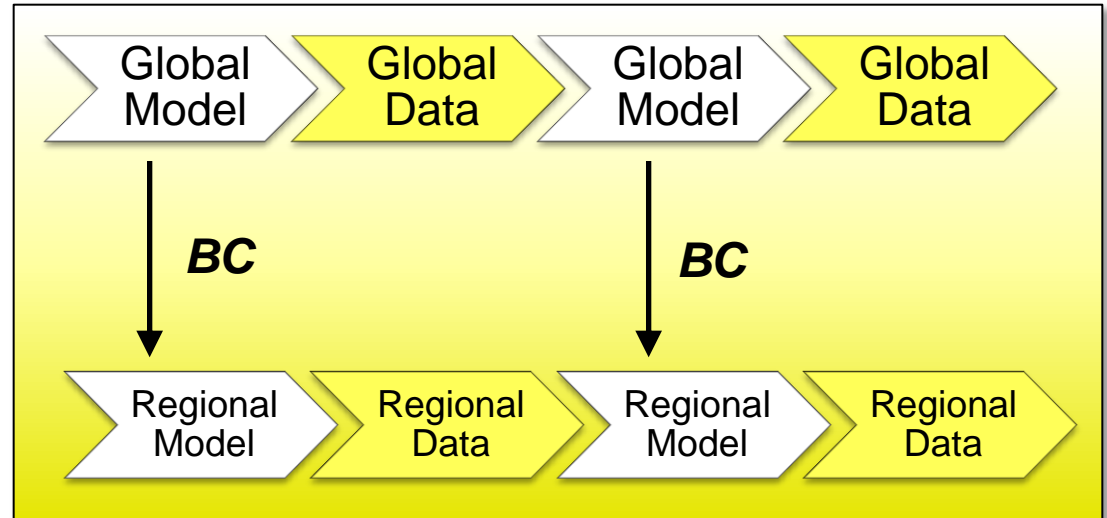

- Test model developments and forecasts in a realistic „small“ or „baby“-cycling environment (BACY)
- Model developments will strongly influence the behaviour of the cycled system and the corresponding forecasts (feedback loops!)
- *Just testing changes of forecasts when model developments are carried out is only a part of what really happens*
- Observe and treat realistic development of biases which often arises by multiplier effect of cycling
- Test the influence of new observations and rather easily integrate them into an NWP environment (without running the whole DB System)

Regional Model needs Boundary Conditions from Global Model

Global Model provides Boundary Conditions

Efficient Treatment of Boundary Data

BACY Experiments: KENDA versus Nudging

Experiments carried out by Hendrik Reich

**Forecast
Shooting
Loop**

- COSMO-DE Domain, 2.8km resolution
- Standard operational configuration of DWD
- Bacy Speed 1.2 i.e. 1.2 simulations days per day
(6 Days Experiment in 5 days)
- Four Experiments with different Setup carried out (adaptivity)

BACY Experiment 4: KENDA versus Nudging

Experiment of HErZ LMU: KENDA versus COSMO-DE-EPS

Deutscher Wetterdienst
Wetter und Klima aus einer Hand

Experiments by Florian Harnisch and Christian Keil, LMU

(1) 15 UTC 10 June - 00 UTC 12 June 2012: → 21-h fc at 00 UTC 11 / 12 June

(2) 06 UTC 18 June - 12 UTC 19 June 2012: → 21-h fc at 12 UTC 18 June

- KENDA**: - 3-hourly LETKF data assimilation of conventional data
- 3-hourly analysis ensemble with **20** ensemble members
 - 20 member ECMWF EPS lateral boundary conditions (16 km)
 - No physics parametrization perturbations (PPP)
 - Multiplicative adaptive covariance inflation

KENDAppp: including 10 physics parametrization perturbations (PPP)

KENDArtp: relaxation-to-prior-perturbation inflation ($\alpha = 0.75$)

KENDArtps: relaxation-to-prior-spread inflation ($\alpha = 0.95$)

KENDArtps40: 40 ensemble members / relaxation-to-prior-spread

Experiments: KENDA versus COSMO-DE-EPS

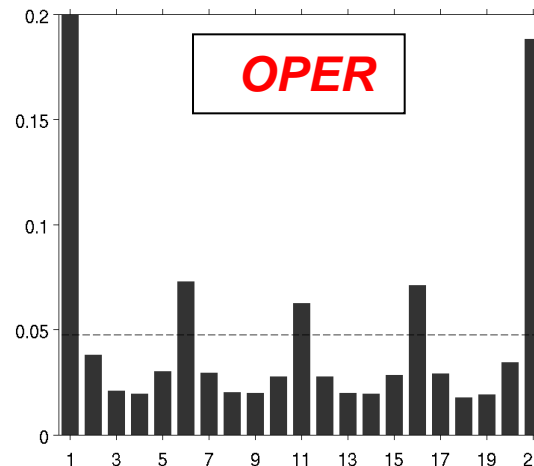

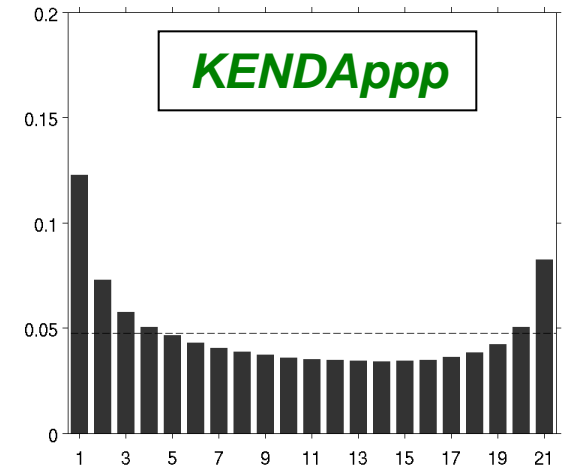

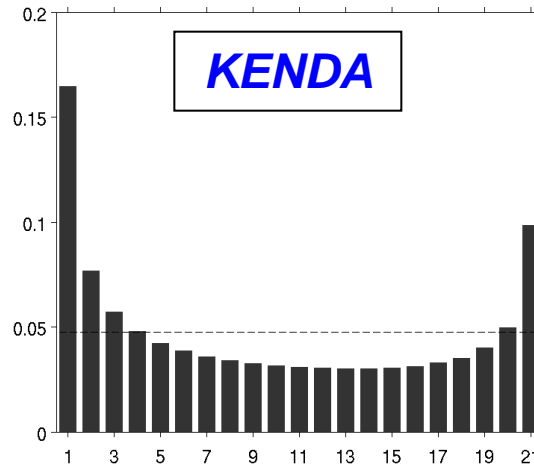

Experiments carried out by
Florian Harnisch and
Christian Keil, LMU

Ensemble rank histogram

**+3 h forecasts of
10 m wind speed**

**EnKF improved versions
Can improve EPS**

Verified against
COSMO-DE
analysis
(similar results
against
observations)

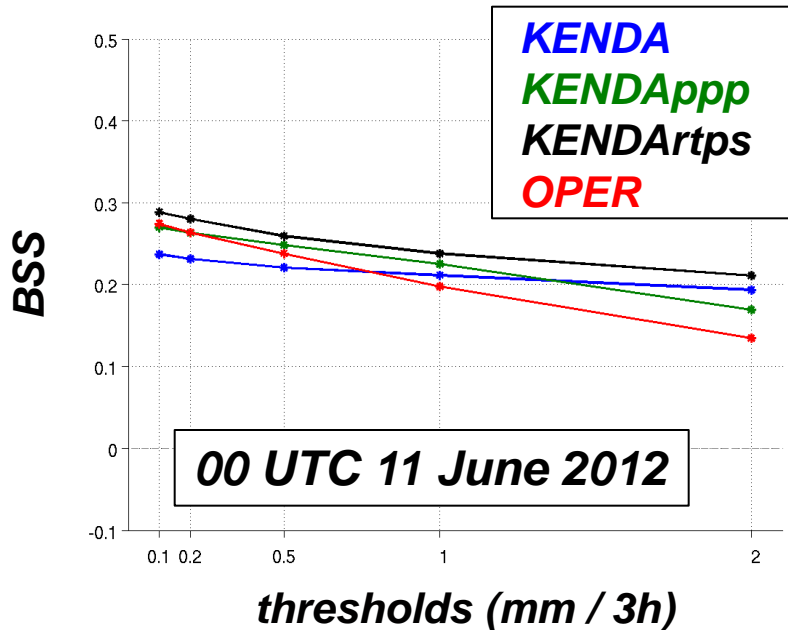

Experiments: KENDA versus COSMO-DE-EPS

EnKF improved versions
Can improve EPS

BSS: 21-h ensemble forecasts of precipitation

3-21 h forecasts averaged over Germany

- Brier Skill Score = [resolution – reliability] / uncertainty
- Accounting for model errors with **PPP** shows positive impact
- Large impact of **inflation** procedure

**Over the past 8 month
ICON development has
strongly benefited from
Basic Cycling (Bacy)**

Basic Cycle

- Elementary Cycling; principle of simplicity
- File Based for Model Fields
- Flexible DB/Files for Observations
- Useful for Debugging
- Basic speed check for DA components
- Needed for efficient NUMEX implementation and test

ICON Basic Cycling Environment
